Overview of Fermion Many-Body Systems

Density Functional Theory for Coulomb Systems

DFT for Nuclei? \implies EFT and RG

Summary I

Dick Furnstahl EFT for DFT I

Examples of Fermion Many-Body Systems

• Collections of "fundamental" fermions (electrons, quarks, ...)

• or of composites of odd number of fermions (e.g., protons)

Examples of Fermion Many-Body Systems

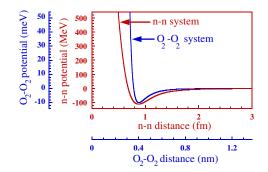

- Collections of "fundamental" fermions (electrons, quarks, ...)
 - or of composites of odd number of fermions (e.g., protons)
- Isolated atoms or molecules
 - electrons interacting via long-range (screened) Coulomb
 - find charge distribution, binding energy, bond lengths, ...
- Bulk solid-state materials
 - metals, insulators, semiconductors, superconductors, ...
- Liquid ³He (superfluid!)
- Cold fermionic atoms in (optical) traps [⁶Li or ⁷Li?]
- Atomic nuclei
- Neutron stars
 - neutron matter
 - color superconducting quark matter

Examples of Fermion Many-Body Systems

The Big Picture (adapted from Richter @INPC2004)

Dick Furnstahl EFT for DFT I

The Many-Body Schrödinger Wave Function

[adapted from Joe Carlson]

→ 帰 ▶ → 臣 ▶ → 臣 ▶ 三目曰 → ○ < (

- How to represent the wave function for an A-body nucleus?
- Consider ⁸Be (Z = 4 protons, N = 4 neutrons)

 $|\Psi
angle = \sum_{\sigma, au} \chi_{\sigma} \chi_{ au} \phi(\mathbf{R})$ where **R** are the 3A spatial coordinates

$$\chi_{\sigma} = \downarrow_1 \uparrow_2 \cdots \downarrow_A (2^A \text{ terms}) = 256 \text{ for } A = 8$$

 $\chi_{\tau} = n_1 n_2 \cdots p_A (\frac{A!}{N!Z!} \text{ terms}) = 70 \text{ for } {}^8\text{Be}$

The Many-Body Schrödinger Wave Function

[adapted from Joe Carlson]

- How to represent the wave function for an A-body nucleus?
- Consider ⁸Be (Z = 4 protons, N = 4 neutrons)

 $|\Psi\rangle = \sum_{\sigma,\tau} \chi_{\sigma} \chi_{\tau} \phi(\mathbf{R})$ where **R** are the 3*A* spatial coordinates

$$\chi_{\sigma} = \downarrow_1 \uparrow_2 \cdots \downarrow_A (2^A \text{ terms}) = 256 \text{ for } A = 8$$

 $\chi_{\tau} = n_1 n_2 \cdots p_A (\frac{A!}{N!Z!} \text{ terms}) = 70 \text{ for } {}^8\text{Be}$

 So for ⁸Be there are 17,920 complex functions in 3A - 3 = 21 dimensions!

The Many-Body Schrödinger Wave Function

[adapted from Joe Carlson]

- How to represent the wave function for an A-body nucleus?
- Consider ⁸Be (Z = 4 protons, N = 4 neutrons)

 $|\Psi
angle = \sum_{\sigma, au} \chi_{\sigma} \chi_{ au} \phi(\mathbf{R})$ where **R** are the 3A spatial coordinates

$$\chi_{\sigma} = \downarrow_1 \uparrow_2 \cdots \downarrow_A (2^A \text{ terms}) = 256 \text{ for } A = 8$$

 $\chi_{\tau} = n_1 n_2 \cdots p_A \left(\frac{A!}{N!Z!} \text{ terms} \right) = 70 \text{ for } {}^8\text{Be}$

- So for ⁸Be there are 17,920 complex functions in 3A - 3 = 21 dimensions!
- Suppose you represent this for a nucleus of size 10 fm with a mesh spacing of 0.5 fm. You would need 10²⁷ grid points!

Hartree-Fock Wave Function

Best single Slater determinant in variational sense

$$|\Psi_{\rm HF}\rangle = \det\{\phi_i(\mathbf{x}), i = 1 \cdots A\}, \quad \mathbf{x} = (\mathbf{r}, \sigma, \tau)$$

• Hartree-Fock energy:

$$\bigcirc \cdots \bigcirc + (\bigcirc) \Rightarrow \bigcirc \bigcirc$$

$$\langle \Psi_{\rm HF} | \hat{\mathcal{H}} | \Psi_{\rm HF} \rangle = \sum_{i=1}^{A} \frac{\hbar^2}{2M} \int d\mathbf{x} \, \nabla \phi_i^* \cdot \nabla \phi_i + \frac{1}{2} \sum_{i,j=1}^{A} \int d\mathbf{x} \int d\mathbf{y} \, |\phi_i(\mathbf{x})|^2 v(\mathbf{x}, \mathbf{y}) |\phi_j(\mathbf{y})|^2 \\ - \frac{1}{2} \sum_{i,j=1}^{A} \int d\mathbf{x} \int d\mathbf{y} \, \phi_i^*(\mathbf{x}) \phi_i(\mathbf{y}) v(\mathbf{x}, \mathbf{y}) \phi_j^*(\mathbf{y}) \phi_j(\mathbf{x}) + \sum_{i=1}^{A} \int d\mathbf{y} \, v_{\rm ext}(\mathbf{y}) |\phi_j(\mathbf{y})|^2$$

• Determine the ϕ_i by varying with fixed normalization:

$$rac{\delta}{\delta \phi_i^*(\mathbf{x})} \Big(\langle \Psi_{
m HF} | \widehat{\mathcal{H}} | \Psi_{
m HF}
angle - \sum_{j=1}^{\mathcal{A}} \epsilon_j \int d\mathbf{y} \, |\phi_j(\mathbf{y})|^2 \Big) = 0$$

Hartree-Fock Wave Function

Best single Slater determinant in variational sense

$$|\Psi_{\rm HF}\rangle = \det\{\phi_i(\mathbf{x}), i = 1 \cdots A\}, \quad \mathbf{x} = (\mathbf{r}, \sigma, \tau)$$

• The $\phi_i(\mathbf{x})$ satisfy *non-local* Schrödinger equations:

$$-\frac{\nabla^2}{2M}\phi_i(\mathbf{x}) + \left(V_{\rm H}(\mathbf{x}) + v_{\rm ext}(\mathbf{x})\right)\phi_i(\mathbf{x}) + \int d\mathbf{y} \ V_{\rm E}(\mathbf{x}, \mathbf{y})\phi_i(\mathbf{y}) = \epsilon_i\phi_i(\mathbf{x})$$

Solve self-consistently; non-trivial because non-local

Outline

Overview of Fermion Many-Body Systems

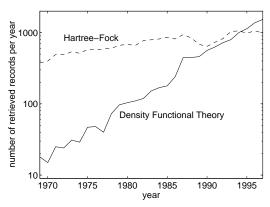

Density Functional Theory for Coulomb Systems

DFT for Nuclei? \Longrightarrow EFT and RG

Summary I

Density Functional Theory (DFT)

- Dominant application: inhomogeneous electron gas
- Interacting point electrons in static potential of atomic nuclei
- "Ab initio" calculations of atoms, molecules, crystals, surfaces, ...

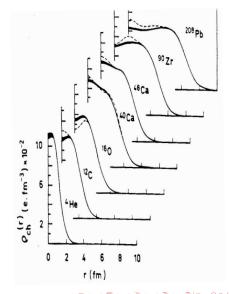

< E

Density Functional Theory (DFT)

 Hohenberg-Kohn: There exists an energy functional *E_{Vext}*[ρ] ...

$$E_{v_{\text{ext}}}[
ho] = F_{\text{HK}}[
ho] + \int d^3x \, v_{\text{ext}}(\mathbf{x})
ho(\mathbf{x})$$

- *F*_{HK} is *universal* (same for any external *v*_{ext}) ⇒ *H*₂ to DNA!
- Useful if you can approximate the energy functional
- Introduce orbitals and minimize energy functional ⇒ E_{gs}, ρ_{gs}

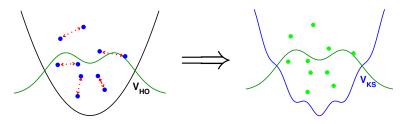

Kohn-Sham DFT for $v_{ext} = V_{HO}$ Harmonic Trap

Dick Furnstahl EFT for DFT I

Kohn-Sham DFT for $v_{ext} = V_{HO}$ Harmonic Trap

Interacting density in V_{HO} ≡ Non-interacting density in V_{KS}
Orbitals {ψ_i(**x**)} in local potential V_{KS}([ρ], **x**)

$$[-\nabla^2/2m + V_{\rm KS}(\mathbf{x})]\psi_i = \varepsilon_i\psi_i \implies \rho(\mathbf{x}) = \sum_{i=1}^A |\psi_i(\mathbf{x})|^2$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 < の Q(

- Find Kohn-Sham potential $V_{\rm KS}([\rho], \mathbf{x})$ from $\delta E_{v_{\rm ext}}[\rho]/\delta \rho(\mathbf{x})$
- Solve self-consistently

DFT for Solid-State or Molecular Systems

• HK free energy for an inhomogeneous electron gas

$$\mathcal{F}_{\mathrm{HK}}[\rho(\mathbf{x})] = \mathcal{T}_{\mathrm{KS}}[\rho(\mathbf{x})] + \frac{e^2}{2} \int d^3x \, d^3x' \frac{\rho(\mathbf{x})\rho(\mathbf{x}')}{|\mathbf{x} - \mathbf{x}'|} + \mathcal{E}_{\mathrm{xc}}[\rho(\mathbf{x})]$$

• Then
$$V_{\rm KS} = v_{\rm ext} - e\phi + v_{\rm xc}$$
 with $v_{\rm xc}({\bf x}) = \delta E_{\rm xc}/\delta
ho({\bf x})$

• Kohn-Sham $T_{KS}[\rho(\mathbf{x})]$: find normalized $\{\psi_i, \epsilon_i\}$ from

$$\left(-\frac{\hbar^2}{2m}\nabla^2+V_{\rm KS}(\mathbf{x})\right)\psi_i(\mathbf{x})=\epsilon_i\psi_i(\mathbf{x})$$

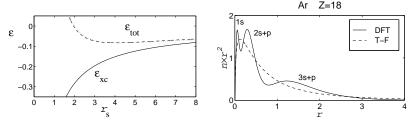

so that $\rho(\mathbf{x}) = \sum_{i=1}^{A} |\psi_i(\mathbf{x})|^2$ and

$$T_{\rm KS}[\rho(\mathbf{x})] = \sum_{i=1}^{A} \langle \psi_i | -\frac{\hbar^2}{2m} \nabla_i^2 | \psi_i \rangle = \sum_{i=1}^{A} \epsilon_i - \int d^3 x \, \rho(\mathbf{x}) \, V_{\rm KS}(\mathbf{x})$$

• Local density approximation: $E_{xc}[\rho(\mathbf{x})] \approx \int d^3x \, \mathcal{E}_{xc}(\rho(\mathbf{x}))$

• fit $\mathcal{E}_{xc}(\rho)$ to Monte Carlo calculation of uniform electron gas

Kohn-Sham

in practice, use parametric formulas for energy density, e.g.,

 $\mathcal{E}_{\rm xc}(\rho)/\rho = -0.458/r_{\rm s} - 0.0666G(r_{\rm s}/11.4)$

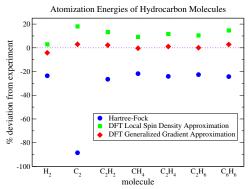

with
$$G(x) = \frac{1}{2} \left\{ (1+x)^3 \log(1+x^{-1}) - x^2 + \frac{1}{2}x - \frac{1}{3} \right\}$$

just like "naive" Hartree approach with additional potential:

$$V_{\rm xc}(\mathbf{x}) = \left. \frac{d[\mathcal{E}_{\rm xc}(\rho)]}{d\rho} \right|_{\rho=\rho(\mathbf{x}), \quad \langle \mathcal{P} \rangle \land \langle$$

Density Functional Theory (DFT)

- Dominant application: inhomogeneous electron gas
- Interacting point electrons in static potential of atomic nuclei
- "Ab initio" calculations of atoms, molecules, crystals, surfaces, ...
- HF is good starting point, DFT/LDA is better, DFT/GGA is best

e.g., van Leeuwen-Baerends GGA

$$v_{\mathrm{xc}}(\mathbf{r}) = -\beta \rho^{1/3}(\mathbf{r}) \frac{x^2(\mathbf{r})}{1 + 3\beta x(\mathbf{r}) \sinh^{-1}(x(\mathbf{r}))}$$

with
$$x = |\nabla \rho| / \rho^{4/3}$$

Dick Furnstahl EFT for DFT I

A Chemist's Guide to DFT (Koch & Holthausen, 2000)

"To many, the success of DFT appeared somewhat miraculous, and maybe even unjust and unjustified. Unjust in view of the easy achievement of accuracy that was so hard to come by in the wave function based methods. And unjustified it appeared to those who doubted the soundness of the theoretical foundations. "

A Chemist's Guide to DFT (Koch & Holthausen, 2000)

"To many, the success of DFT appeared somewhat miraculous, and maybe even unjust and unjustified. Unjust in view of the easy achievement of accuracy that was so hard to come by in the wave function based methods. And unjustified it appeared to those who doubted the soundness of the theoretical foundations. "

Density Functional Theory (AJP, Argaman & Makov, 2000)

"It is important to stress that all practical applications of DFT rest on essentially uncontrolled approximations, such as the LDA ..."

And unjustified it appeared to those who doubted the soundness of the theoretical foundations. "

Density Functional Theory (AJP, Argaman & Makov, 2000)

"It is important to stress that all practical applications of DFT rest on essentially uncontrolled approximations, such as the LDA ..."

Meta-Generalized Gradient Approximation (Perdew et al., 1999)

"Some say that 'there is no systematic way to construct density functional approximations.' But there are more or less systematic ways, and the approach taken ... here is one of the former."

Preview of DFT as Effective Action

- Recall ordinary thermodynamics with N particles at T = 0
- Use a chemical potential μ as source to change $\langle \hat{N} \rangle$

$$\Omega(\mu) = -kT \ln Z(\mu)$$
 and $N = -\left(\frac{\partial \Omega}{\partial \mu}\right)_{TV}$

• Invert to find $\mu(N)$, Legendre transform to F(N)

$$F(N) = \Omega(\mu(N)) + \mu(N)N$$

 \implies This is our energy function!

得下 イヨト イヨト ヨヨ つく(

(Nuclear) Many-Body Physics: "Old" Approach

One Hamiltonian for all problems and energy/length scales (not QCD!)	For nuclear structure, protons and neutrons with a <i>local</i> potential fit to NN data

For nuclear structure, protons and neutrons with a <i>local</i> potential fit to NN data
NN potential with $\chi^2/dof \approx$ 1 up to \sim 300 MeV energy

(Nuclear) Many-Body Physics: "Old" Approach

One Hamiltonian for all problems and energy/length scales (not QCD!)	For nuclear structure, protons and neutrons with a <i>local</i> potential fit to NN data
Find the "best" potential	NN potential with $\chi^2/{ m dof}pprox$ 1 up to \sim 300 MeV energy
Two-body data may be sufficient; many-body forces as last resort	Let phenomenology dictate whether three-body forces are needed (answer: yes!)

(Nuclear) Many-Body Physics: "Old" Approach

One Hamiltonian for all problems and energy/length scales (not QCD!)	For nuclear structure, protons and neutrons with a <i>local</i> potential fit to NN data
Find the "best" potential	NN potential with $\chi^2/{ m dof} pprox$ 1 up to \sim 300 MeV energy
Two-body data may be sufficient; many-body forces as last resort	Let phenomenology dictate whether three-body forces are needed (answer: yes!)
Avoid (hide) divergences	Add "form factor" to suppress high-energy intermediate states; don't consider cutoff dependence

(Nuclear) Many-Body Physics: "Old" Approach

One Hamiltonian for all problems and energy/length scales (not QCD!)	For nuclear structure, protons and neutrons with a <i>local</i> potential fit to NN data
Find the "best" potential	NN potential with $\chi^2/{ m dof} pprox$ 1 up to \sim 300 MeV energy
Two-body data may be sufficient; many-body forces as last resort	Let phenomenology dictate whether three-body forces are needed (answer: yes!)
Avoid (hide) divergences	Add "form factor" to suppress high-energy intermediate states; don't consider cutoff dependence
Choose approximations by "art"	Use physical arguments (often handwaving) to justify the subset of diagrams used

Why Use EFT For Many-Body Physics?

- Systematic calculations with error estimates
- Reliable, model independent extrapolation
- Analogy between EFT and basic numerical analysis
 - naive error analysis: pick a method and reduce the mesh size (e.g., increase grid points) until the error is "acceptable"
 - sophisticated error analysis: understand scaling and sources of error (e.g., algorithm vs. round-off errors)

 \implies Does it work as well as it should?

- representation dependence

 not all are equally effective!
- extrapolation: completeness of an expansion basis
- Quantum mechanics makes EFT trickier!

Density Functional Theory for Coulomb Systems

DFT for Nuclei? \Longrightarrow EFT and RG

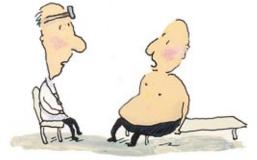

Summary I

Bethe and Calculating Nuclear Matter

• Hans Bethe in review of nuclear matter (1971):

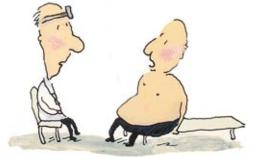

"The theory must be such that it can deal with any nucleon-nucleon (NN) force, including hard or 'soft' core, tensor forces, and other complications. It ought not to be necessary to tailor the NN force for the sake of making the computation of nuclear matter (or finite nuclei) easier, but the force should be chosen on the basis of NN experiments (and possibly subsidiary experimental evidence, like the binding energy of H^3)."

문제 제품에 문제

Is Three-Body Contribution Out of Control?

Check ratios:

물 이 제 물 이 물 물

- Saturation driven by 3NF
- Unnaturally large?
- Chiral: $\langle V_{3N} \rangle \sim (Q/\Lambda)^3 \langle V_{NN} \rangle$ \implies consistent
- Power counting still needed with NN + 3N HF at LO
- Four-body contributions?
